

XML & MusicXML

craig@ccrma.stanford.edu

24 February 2015

XML Development

- eXtensible Markup Language

XHTML 1.0 [2000](#)
 1.1 [2001](#)

XHTML5 [2008](#)

[Version 0](#) :: 1996
[Version 1.0](#) :: 1998
[Version 1.1](#) :: 2004
[Version 1.1.5](#) :: 2008

<http://en.wikipedia.org/wiki/XML>

- Predecessor: SGML (Standardized Generalized Markup Language)

HTML 1.0 [1991](#)
 2.0 [1995](#)
 4.0 [1997](#)
 5.0 [2008](#)

[1970's – 1980's](#)

http://en.wikipedia.org/wiki/Standard_Generalized_Markup_Language

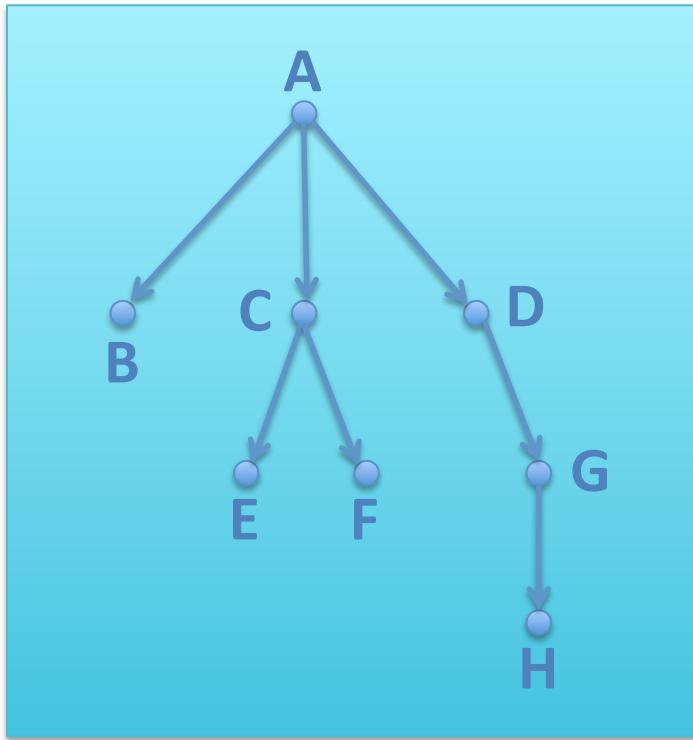

- Predecessor: GML (Generalize Markup Language)

[1960's](#)

http://en.wikipedia.org/wiki/IBM_Generalized_Markup_Language

XML data structure

- XML describes a tree structure:

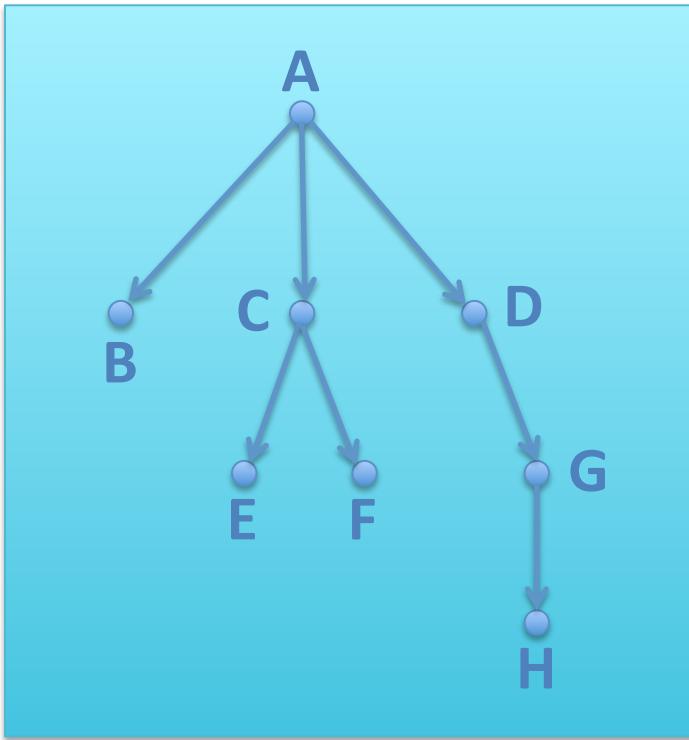

- Serialization:

```
<A>
<B/>
<C>
<E/>
<F/>
</C>
<D>
<G>
<H/>
</G>
</D>
</A>
```

- Equivalent serialization: `<A><C><E/><F/></C><D><G><H/></G></D>`

XML data structure

- XML describes a tree structure:

- Same data structure as directories/folders on a hard disk
- Same conceptualization as LISP code:
(A B (C E F) (D (G (H)))))
- SharpEye's internal format is a tree structure (but not XML)
- JSON data format is also a tree structure. (with a simpler syntax than XML).

XML Terminology

<A>

<C>

<E/>

<F/>

</C>

<D>

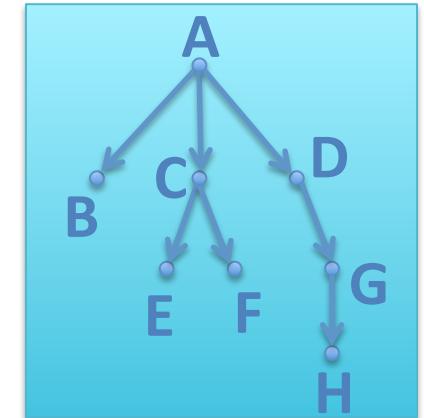

<G>

<H/>

</G>

</D>

- <C>...</C> is an **element** (tree node)
- C is the element's **name**
- <C> is a **start tag**
- </C> is an end tag
- <E/> and <F/> are **element content** of <C>
- Plain text inside of an element is **text content**

- <H/> is an element without contents (terminal node)
- <H/> is equivalent to <H></H>
- Start tags must be followed by matching end tag, or the shorthand <xxx/> must be used.

Element Attributes

- Elements can contain a list of attributes within the start tag

```
<A a="1" b="two" c="1 and 2">
```

- Element **A** has three *attributes*: **a**, **b**, and **c**.
- A is the *name* of the attribute, 1 is its *value*.
- Attributes must have values. **c=""** represents an attribute without a value.
- Attributes are optional (similar to key values in LISP).
- The value of **a** is **1**, the value of **b** is **two** and the value of **c** is **1 and 2**.
- XML Attribute values *must* be enclosed in double or single quotes.
- Only one attribute of a given name allowed. Bad example: ****
- Attributes are considered unordered:

**** is identical to ****

HTML attributes do not need to be enclosed in quotes:

<table cellpadding=10> is equivalent to **<table cellpadding="10">**

XHTML does not allow the first case since quotes are always needed.

Elements vs. Attributes

- Elements can contain subelements
- Attributes cannot contain subattributes
- Two similar (but not identical) ways of expressing the same data:

```
<A a="1" b="two" c="1 and 2"/>
```

```
<A>
  <a>1</a>
  <b>two</b>
  <c>1 and 2</c>
</A>
```

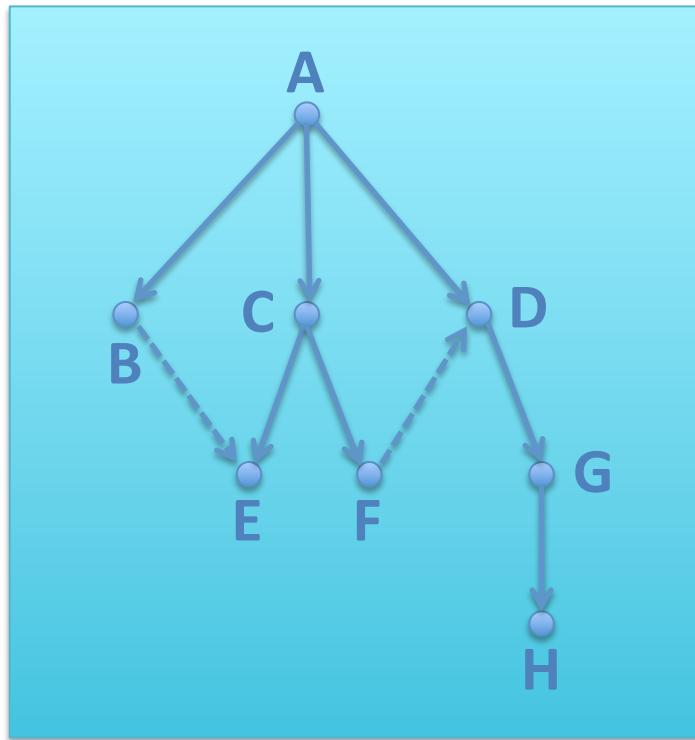

Informal shorthand for attribute **a** of element **A** (but not in data):

A@a

- Attribute **a** in the first example cannot be expanded later into subattributes
- Element **a** in the second example can be expanded later to include element contents

XML for non-tree structured data

- non-tree data can be shoe-horned into XML data structure

- Tree-like portions encoded as XML elements
- Non-tree connections handled by specialized id/idref/idrefs attributes.

```
<A>
<B idref="e"/>
<C>
<E id="e"/>
<F idref="d"/>
</C>
<D id="d">
<G>
<H/>
</G>
</D>
</A>
```

DTD:

```
<!ATTLIST B
  id      ID      #IMPLIED
  idref   IDREF   #IMPLIED>
```

- Similar to pointers in C.

XML declaration

- Used to indicate that the following data is XML data
- First characters in file must be “<?xml” (see UTF-16 below).

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
```

Three attributes which *must* be in this order (but optional):

@version = version of XML being used (1.0 or 1.1).

@encoding = character set being used in data. (also UTF-16 which requires two endian bytes before opening <?)
* UTF-8 is backwards compatible with 7-bit ASCII
* UTF-16 is not.

@standalone = “yes” if no external definition file, “no” if DTD (Document Type Definition).

XML complete data file

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<A>
    <B idref="e"/>
    <C>
        <E id="e"/>
        <F idref="d"/>
    </C>
    <D id="d">
        <G>
            <H/>
        </G>
    </D>
</A>
```

Even more complete data file

```
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<!DOCTYPE A [
    <!ELEMENT A (B,C,D)>      -----> Element A can have subelements B, C & D.
    <!ELEMENT C (E,F)>
    <!ELEMENT D (G)>
    <!ELEMENT G (H)>
    <!ATTLIST B idref IDREF #IMPLIED> - - -> Element B can have an attribute named idref
    <!ATTLIST E id    ID    #IMPLIED> which can be set to a value which is the type
    <!ATTLIST D id    ID    #IMPLIED> IDREF.
]>
<A>
    <B idref="e"/>
    <C>
        <E id="e"/>
        <F idref="d"/>
    </C>
    <D id="d">
        <G>
            <H/>
        </G>
    </D>
</A>
```

Data/Structure definition separation

<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<!DOCTYPE A SYSTEM "tree.dtd">

or <!DOCTYPE A SYSTEM "http://somewhere.com/tree.dtd">

or <!DOCTYPE A PUBLIC "-//Owner/Class Description//Language//Version" "tree.dtd">

<A> Formal Public Identifier

<B idref="e"/>

<C>

<E id="e"/>

<F idref="d"/>

</C>

<D id="d">

<G>

<H/>

</G>

</D>

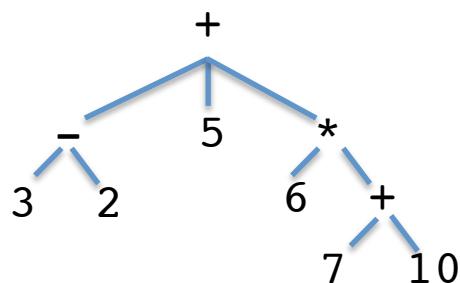

tree.dtd:

```
<!ELEMENT A (B,C,D)>
<!ELEMENT C (E,F)>
<!ELEMENT D (G)>
<!ELEMENT G (H)>
<!ATTLIST B idref IDREF #IMPLIED>
<!ATTLIST E id ID #IMPLIED>
<!ATTLIST D id ID #IMPLIED>
```

Parameters

Fixed	function(int one, int two, int three) (like MIDI)	C
Optional	function(int one, int two = 2, int three=3) (like Guido, SCORE)	C++
Variable	function(const char* format, ...) http://ccByExamples.com/2007/01/18/va-list-create-function-like printf-2	
Key	(function :key1 value1 :key2 value2)	Lisp

Tree (+ (- 3 2) 5 (* 6 (+ 7 10))) (recursive key system)

MIDI Parameters

- All MIDI protocol parameters are **fixed** except for “system exclusive messages”
- Meta messages (component of MIDI files, not MIDI protocol) are **variable**.

0x90 60 127

note(channel, key, velocity)

0xE6 0x7f 0x7f

bend(channel, LSB, MSB)

- Allows hot-plugging of MIDI cable.
- Limits **expandability** (function space maximized with fixed parameter commands)

SCORE Parameters

- SCORE items are all **variable** length fixed parameter lists.
- Similar to MIDI meta message system, but better extensibility
- Identical to Music V (C Sound) parameter system

<http://www.csounds.com/chapter1/index.html>

```
8 1 0 0 0.6 128.146
14 1 0 3
3 1 1.2 0 0.8
17 1 5.997 0 -1
1 1 9.297 7 20 1 2
1 1 20.566 4 10 2 4
1 1 50.64 8 20 1 2
5 1 50.64 8.5 8.5 64.016 1.579 -2
14 1 61.923 1
1 1 64.016 8 20 1 2
1 1 75.291 6 10 1 2
1 1 86.561 5 10 2 4
14 1 109.113 1
1 1 111.206 9 20 2 4
14 1 128.146 1 3
```

- Allows for both forwards and backwards compatibility:
 - New parameters added to end of current list
 - Old program ignores (but preserves) unknown parameters.

Non-XML data trees

- SharpEye uses a form of tree structure for its data
- LISP-based ENP music editor uses tree structure:

```
(:begin :score
  (:begin :part1
    :staff :treble-staff
    :key-signature :g-major
    :time-signature (3 4)
    (:begin :voice1
      (
        :time-signature (3 4 :kind :pickup)
        (1 ((1 :notes (67))))
      )
      (:begin :measure1
        (2 ((1 :notes (67)))
          (1 ((1 :notes (74)))))
      )
      (:begin :measure2
        (2 (
          (3 :notes (71))
          (1 :notes (69))
        ))
        (1 ((1 :notes (67))))
      )
      (:begin :measure3
        (2 (
          (3 :notes (67))
          (1 :notes (69))
        ))
        (1 ((1 :notes (71))))
      )
    )
  )
)
```

XML as a container for non-tree data

```
8 1 0.000 0 0 100
3 1 1.500
17 1 9.444 0 1
18 1 13.444 0 3 4
1 1 20.944 5 10 0 1.0
14 1 32.290 1
1 1 35.679 5 10 1 2.0
1 1 52.032 2 10 0 1.0
14 1 63.378 1
1 1 66.767 7 20 0 1.5 0 10
1 1 80.853 6 10 0 0.5 0 1
1 1 88.654 5 10 0 1.0
14 1 100.000 1
```

```
<SCORE version="4">
  <item p1="8" p2="1" p6="100" />
  <item p1="3" p2="1" p3="1.5" />
  <item p1="17" p2="1" p3="9.444" p5="1" />
  <item p1="18" p2="1" p3="13.444" p5="3" p6="4" />
  <item p1="1" p2="1" p3="20.944" p4="5" p5="10" p7="1" />
  <item p1="14" p2="1" p3="32.29" p4="1" />
  <item p1="1" p2="1" p3="35.679" p4="5" p5="10" p6="1" p7="2" />
  <item p1="1" p2="1" p3="52.032" p4="2" p5="10" p7="1" />

  <item p1="14" p2="1" p3="100" p4="1" />
</SCORE>
```

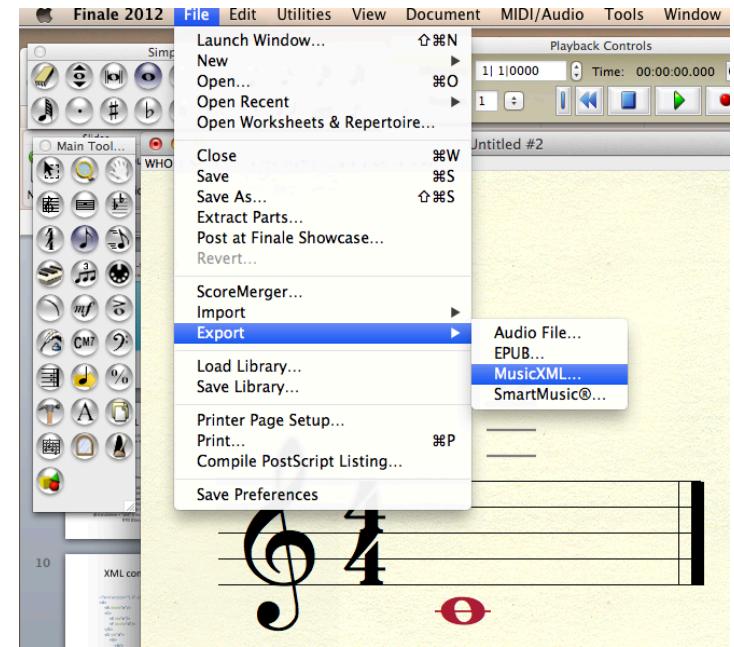

XML

- Advantage: Simple parsing model for data storage
 - Like MIDI, SCORE, LISP, Humdrum
 - Unlike Guido, Lilypond, C, C++, Java, JavaScript (lex/bison type formats)
- Allows for hierarchical structuring of data
 - **Good:** music notation usually fits well into hierarchical model
 - Useful for manipulating music
 - **Bad:** music notation is 2-dimensional, XML is 1-dimensional
(superposition of multiple hierarchies)
- Allows for forwards compatibility, and backwards compatibility if careful
 - Possible to add new parameters without altering parsing

MusicXML

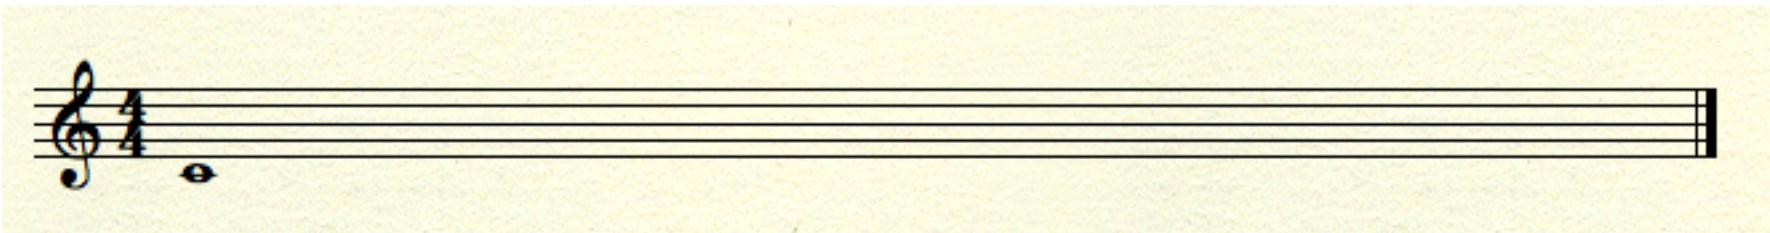

```
<?xml version="1.0" encoding="UTF-8" standalone="no"?>
<!DOCTYPE score-partwise PUBLIC "-//Recordare//DTD MusicXML 1.0 Partwise//EN"
  "http://www.musicxml.org/dtds/1.0/partwise.dtd">

Voice 2:

Partwise/timewise

- <score-partwise> stores score one part (staff) sequentially (part->measure)
- <score-timewise> score each measure sequentially for all parts (measure->part)
- <score-timewise> is about as common as MIDI Type-2 files.
- <score-timewise> is a quasi-realtime encoding (not strictly real-time).

- <score-partwise>: ABCD, EFGH, IJKL, MNOP, QRST, UVWX
- <score-timewise>: AEIMQU, BFJNRV, CGKOSW, DHLPTX
- <opus>: multiple movements of (partwise or timewise).
